PROFESSIONAL SUMMARY

Fresher Data Analyst with hands-on expertise in Python (Pandas, NumPy, Matplotlib, Seaborn), SQL, PostgreSQL, and Power BI. Delivered two end-to-end analytics projects — processing 984 patient records in the healthcare domain and 100+ customer profiles in retail — uncovering actionable insights through EDA, optimized SQL queries, and multi-page interactive dashboards. Quick learner with strong analytical thinking, domain versatility, and a structured approach to transforming raw data into business decisions.

CAREER HIGHLIGHTS

- Processed 984 patient records and identified Cancer as the highest-cost treatment at avg \$25K and 42.65 days average stay — enabling smarter resource allocation.
- Engineered 18 features across 100 customer profiles; identified Footwear as the top revenue category and quantified discount impact on purchase frequency.
- Authored 18 optimized SQL queries across two PostgreSQL projects covering disease frequency, treatment duration, revenue trends, and seasonal patterns.
- Delivered 3-page Power BI dashboards with drill-through filters for healthcare and retail stakeholder decision-making.

CORE SKILLS

Languages: Python, SQL

Libraries: Pandas, NumPy, Matplotlib, Seaborn

Databases: PostgreSQL, MySQL, MongoDB

Visualization: Power BI, Microsoft Excel

Tools: Git, GitHub, Jupyter Notebook

Concepts: Data Cleaning, EDA, Feature Engineering, Dashboard Development, SQL Optimization, Requirements Gathering

PROJECTS

Hospital Patient & Treatment Analysis | *Python, SQL, PostgreSQL, Power BI* | [GitHub](#)

- Ingested and cleaned 984 patient records across 10 variables; performed EDA to identify disease patterns, treatment cost outliers, and hospital stay distributions.
- Designed and executed 8 optimized PostgreSQL queries to surface disease frequency, average treatment duration, and cost drivers by diagnosis category.
- Delivered a 3-page Power BI dashboard with drill-through filters enabling healthcare stakeholders to track KPIs and reallocate resources efficiently.
- Key finding:** Cancer recorded the highest avg treatment cost (\$25K) and longest hospital stay (42.65 days), directly supporting capacity planning decisions.

Customer Shopping Behaviour Analysis | *Python, SQL, PostgreSQL, Power BI* | [GitHub](#)

- Processed 100 customer profiles with 18 engineered features including age group segmentation and purchase frequency index to enrich analytical depth.
- Authored 10 SQL queries in PostgreSQL to extract revenue trends, seasonal behaviour, discount impact, and payment method distribution across customer segments.
- Built an interactive Power BI report highlighting product category performance and promotional effectiveness for retail strategy teams.
- Key finding:** Footwear is the top-performing revenue category; targeted discounting increased purchase frequency significantly across mid-tier customer segments.

CERTIFICATIONS

Data Analyst Course — 360DigiTMG | *March 2026*

Data collection, cleaning, and analysis using Python and SQL

Data Analyst Masterclass — Novitech RD Pvt Ltd | *March 2026*

Hands-on Python, Pandas, and real-world dataset analysis

EDUCATION

B.Sc Information Technology SNMV Arts & Science College, Coimbatore | *2020–2023* | *7.0 / 10 CGPA*
